**Office Action Summary**

Application No.

09/607,786

Applicant(s)

GAO ET AL.

Examiner

Lamont M Spooner

Art Unit

2654

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 30 June 2000.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-35 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-35 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 30 June 2000 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date 6.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_.

**DETAILED ACTION**

***Claim Rejections - 35 USC § 102***

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-6, 14-21, 25-30, 32 and 33 are rejected under 35 U.S.C. 102(e) as being anticipated by Ramaswamy et al. (U.S. Patent No. 6,188,976 filed Oct. 23, 1998).

As per **claims 1, 18, 19, 20, 27 and 28** Ramaswamy et al. discloses a method comprising:

developing a language model from a tuning set of information (C.2.lines 44-48);  
segmenting at least a subset of received textual corpus and calculating a perplexity value for each segment (C.4.lines 13-20-the external corpus is segmented into linguistic units and a perplexity value is calculated for each unit);

refining the language model with one or more segments of the received corpus based, at least in part, on the calculated perplexity value for the one or more segments (C.3.lines 47-52, C.4.lines 45-47-the language model is updated based upon the perplexity value).

As per **claim 2, 21**, Ramaswamy et al. discloses all of the limitations of claim 1, upon which claim 2 depends. Ramaswamy et al. further discloses:

the tuning set of information (C.5.lines 36-38-test corpus) is application specific (C.5.lines 40-44-the application is speech recognition).

As per **claim 3**, Ramaswamy et al. discloses all of the limitations of claim 1, upon which claim 3 depends. Ramaswamy et al. further discloses:

the tuning set of information is comprised of one or more application-specific documents (C.7.lines 6-9,-the application is e-mail, the documents comprise "show me the next e-mail...")

As per **claim 4**, Ramaswamy et al. discloses all of the limitations of claim 1, upon which claim 4 depends. Ramaswamy et al. further discloses:

the tuning set of information is a highly accurate set of textual information linguistically relevant to (C.2.lines 55-58), but not taken from, the received textual corpus (C.3.lines 14-18, the received corpus-external corpus comprises many domains, however the seed corpus is linguistically related, but not taken from the external corpus).

As per **claim 5**, Ramaswamy et al. discloses all of the limitations of claim 1, upon which claim 5 depends. Ramaswamy et al. further discloses:

a training set comprised of at least the subset of the received textual corpus (C.3.lines 6-8,14-17-test corpus is at least the subset of the received textual corpus).

As per **claim 6**, Ramaswamy et al. discloses all of the limitations of claim 5, upon which claim 6 depends. Ramaswamy et al. further discloses:

ranking the segments of the training set based, at least in part, on the calculated perplexity value for each segment (C.4.lines 36-41, C.8.lines 34-36),

As per **claim 14**, Ramaswamy et al. discloses all of the limitations of claim 1, upon which claim 14 depends. Ramaswamy et al. further discloses:

the perplexity value is a measure of the predictive power of a certain language model to a segment of the received corpus (C.4.lines 16-21).

As per **claim 15**, Ramaswamy et al. discloses all of the limitations of claim 1, upon which claim 15 depends. Ramaswamy et al. further discloses:

ranking the segments of at least the subset of the received corpus based, at least in part, on the calculated perplexity value of each segment (C.4.lines 36-40, C.8.lines 34, 35); and

updating the tuning set of information with one or more of the segments from at least the subset of the received corpus (C.4.lines 41-47).

As per **claim 16**, Ramaswamy et al. discloses all of the limitations of claim 15, upon which claim 16 depends. Ramaswamy et al. further discloses:

one or more of the segments with the lowest perplexity value from at least the subset of the received corpus are added to the tuning set (C.4.lines 41-47- "...below the perplexity threshold...").

As per **claims 17 and 25**, Ramaswamy et al. discloses all of the limitations of claim 1, upon which claim 17 depends. Ramaswamy et al. further discloses:

utilizing the refined language model in an application (C.5.lines 40-42, the application is speech recognition) to predict a likelihood of another corpus (C.5.lines 42-45-the likelihood is interpreted as the "accuracy...for the current language model"-the other corpus is the test corpus).

Art Unit: 2654

As per **claim 26**, Ramaswamy et al. discloses all of the limitations of claim 25, upon which claim 26 depends. Ramaswamy et al. further discloses:

the application is one or more of a spelling and/or grammar checker, a word-processor, a speech recognition application, a language translation application, and the like (C.5.lines 40-42, the application is speech recognition).

As per **claim 29**, Ramaswamy et al. discloses all of the limitations of claim 28, upon which claim 29 depends. Ramaswamy et al. further discloses:

the tuning set is dynamically selected as relevant to the received corpus (C.3.lines 47-54).

As per **claim 30**, Ramaswamy et al. discloses all of the limitations of claim 28, upon which claim 30 depends. Ramaswamy et al. further discloses:

a dynamic lexicon generation function, to develop an initial lexicon from the tuning set (C.3.lines 42-44-the tuning set (seed corpus) is used to develop an initial lexicon (corpus)), and to update the lexicon with the select segments from the received corpus (C.3.lines 50-55- "...adding linguistic units to relevant corpus"-the relevant corpus being the updated lexicon).

As per **claim 32**, Ramaswamy et al. discloses all of the limitations of claim 28, upon which claim 32 depends. Ramaswamy et al further discloses:

a dynamic segmentation function (C.5.lines 1-3), to iteratively segment the received corpus (C.5.lines 1-3) to improve a predictive performance attribute of the modeling agent (C.5.lines 6-9-"to improve language model quality..." comprising evaluating perplexity change which is interpreted as the predictive performance).

Art Unit: 2654

As per **claim 33**, Ramaswamy et al. discloses all of the limitations of claim 32, upon which claim 33 depends. Ramaswamy et al further discloses:

the dynamic segmentation function iteratively re-segments the received corpus until the language model reaches an acceptable threshold (C.5.lines 1,2, 9-15-the external corpus is segmented, iteratively by extracting linguistic units, until the language model is updated once a "...a certain number..." a threshold is reached).

***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 7-13, 22-24, 31, 34 and 35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ramaswamy et al in view of Bangalore et al. (U.S. Patent No. 6,317,707 filed Dec. 7,1998)

Ramaswamy et al. and Bangalore et al. are analogous art in that they both deal with language modeling.

As per **claims 7 and 24**, Ramaswamy et al. discloses all of the limitations of claim 1, upon which claim 7 depends. Ramaswamy et al. further discloses:

clustering every N-items of the received corpus into a training unit, wherein resultant training units are separated by gaps (C.6.line 67, C.7.lines 1, 2-the separate classes inherently includes gaps);

Ramaswamy et al. does not disclose:

calculating the similarity within a sequence of training chunks on either side of each of the gaps; and

select segment boundaries that maximize intra-segment similarity and inter-segment disparity.

However, as it is well known in the art, Bangalore et al. teaches calculating the similarity within a sequence of training chunks (C.3.lines 15-18, 22, 23-the calculated radius determines the similarity) and selecting segment boundaries that maximize intra-segment similarity and inter-segment disparity (C.3.lines 15, 16-the radius indicates the selected boundaries and compactness maximizes segment similarity and inter-segment disparity). Therefore, it would have been obvious at the time of the invention to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to incorporate a well known clustering method of training data/chunks to group similar items and diverge dissimilar items.

As per **claim 8**, Ramaswamy et al. and Bangalore et al. disclose all of the limitations of claim 7, upon which claim 8 depends. Ramaswamy et al. further discloses:

the resultant segment defines a training chunk (C.7.lines 14-18-the word class is the chunk that is then used in subsequent processing steps).

As per **claim 9**, Ramaswamy et al. and Bangalore et al. disclose all of the limitations of claim 7, upon which claim 9 depends. Ramaswamy et al. does not disclose:

N is an empirically derived value based, at least in part, on the size of the received corpus.

However, as it is well known in the art, Bangalore et al. teaches having an empirically derived N-vector for each item in the corpus, which thereby is based upon the size of the corpus (C.2.lines 59-65) and every item is included in the vector space (C.3.lines 7,8, Fig 2). Therefore, at the time of the invention, it would have been obvious to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to include every item in the clustering process to better improve subsequent language modeling results.

As per **claim 10**, Ramaswamy et al. and Bangalore et al. disclose all of the limitations of claim 7, upon which claim 10 depends. Ramaswamy et al. does not disclose:

the calculation of the similarity within a sequence of training units defines a cohesion score.

However, as it is well known in the art, Bangalore et al. teaches the calculation of the similarity within a sequence of training units (C.3.lines 22, 23) defines a cohesion score (C.3.lines 15-19 "very close relationship.." is interpreted as the cohesion). Therefore, at the time of the invention, it would have been obvious to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to determine how close or similar the training units were to each other for the benefit of maximizing the clustering process of related items, to better improve subsequent language modeling results.

As per **claim 11**, Ramaswamy et al. and Bangalore et al. disclose all of the limitations of claim 10, upon which claim 11 depends. Ramaswamy et al. does not disclose:

intra-segment similarity is measured by the cohesion score.

However, as it is well known in the art, Bangalore et al. teaches intra-segment similarity is measured by the cohesion score (C.3.lines 15-19, 22, 23). Therefore, at the time of the invention, it would have been obvious to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to measure how close or similar the intra-segment training units were to each other for the benefit of maximizing the clustering process of related items, to better improve subsequent language modeling results.

As per **claim 12**, Ramaswamy et al. and Bangalore et al. disclose all of the limitations of claim 7, upon which claim 12 depends. Ramaswamy et al. does not disclose:

inter-segment disparity is approximated from the cohesion score.

However, as it is well known in the art, Bangalore et al. teaches inter-segment (C.3.lines 24, 25-the different vector coordinates interpreted inter-segments) is approximated from the cohesion score (C.4, lines 35-45, Table 2-the "Compactness Value"-determines the score and cohesion and the "Class Index"-determines the inter-segment disparity resulting from the cohesion score). Therefore, at the time of the invention, it would have been obvious to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to determine how disparate or distinct

Art Unit: 2654

the inter-segment training units were to each other for the benefit of maximizing the clustering process of related items, to better improve subsequent language modeling results.

As per **claim 13**, Ramaswamy et al. and Bangalore et al. disclose all of the limitations of claim 7, upon which claim 13 depends. Ramaswamy et al. does not disclose:

the calculation of inter-segment disparity defines a depth score.

However, as it is well known in the art, Bangalore et al. teaches the calculation of inter-segment disparity defines a depth score (C.4.lines 12-16, 30-66-Table 2 the depth of the inter-segment disparity approximated form the cohesion score-compactness value- is indicated as the values are "deeper" as they are farther down the list). Therefore, at the time of the invention, it would have been obviousness to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to determine the depth of the disparity in a ranked manner to visually determine the relatedness of different classes or inter-segment disparity.

As per **claim 22**, Ramaswamy et al. discloses all of the limitations of claim 20, upon which claim 22 depends. Ramaswamy et al. does not disclose:

the language model agent ranks the segments of the training set based, at least in part, on a measure of similarity between two or more segments.

However, as it is well known in the art, Bangalore et al. teaches ranking the segments of a training set based on a measure of similarity (C.4.lines 9-16, compactness value between segments) between segments. Therefore, at the time of

Art Unit: 2654

the invention, it would have been obvious to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to identify by a ranking system the segments of varied similarity measurements in order to maximize the clustering process to further improve any successive language modeling resulting from using the provided clustering data.

As per **claim 23**, Ramaswamy et al. and Bangalore et al. disclose all of the limitations of claim 22, upon which claim 23 depends. Ramaswamy et al. does not disclose:

the similarity measure is calculated for adjacent segments.

However, as it is well known in the art, Bangalore et al. teaches having a similarity measure calculated for adjacent segments (C.2.lines 29-31, C.2.lines 59-65, C.3.line 1, C.3.lines 15-17). Therefore, at the time of the invention, it would have been obvious to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to obtain similarity measurements of adjacent segments in order to maximize the clustering process to further improve any successive language modeling resulting from using the provided clustering data.

As per **claim 31**, Ramaswamy et al. discloses all of the limitations of claim 28, upon which claim 31 depends. Ramaswamy et al. does not disclose:

a frequency analysis function, to determine a frequency of occurrence of segments within the received corpus.

However, as it is well known in the art, Bangalore et al. teaches having a function based upon frequencies for each input word, which determines the frequencies of

Art Unit: 2654

segments within the received corpus (C.2.lines 59, 60). Therefore, at the time of the invention, it would have been obvious to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to assist in building a cluster in the well known method of having a vector space to hold the clusters with the frequency of each segment being incorporated into the cluster for the benefit of maximizing the clustering segments, to better improve subsequent language modeling results.

As per **claim 34**, Ramaswamy et al. discloses all of the limitations of claim 32, upon which claim 34 depends. Ramaswamy et al. does not disclose:

a frequency analysis function, to determine a frequency of occurrence of segments within the received corpus.

However, as it is well known in the art, Bangalore et al. teaches having a function based upon frequencies for each input word, which determines the frequencies of segments within the received corpus (C.2.lines 59, 60). Therefore, at the time of the invention, it would have been obvious to combine Ramaswamy et al. with Bangalore et al. The motivation for doing so would have been to assist in dynamically building a cluster in the well known method of having a vector space to hold the clusters with the frequency of each segment being incorporated into the cluster for the benefit of maximizing the clustering segments, to better improve subsequent language modeling results.

As per **claim 35**, Ramaswamy et al. and Bangalore et al. disclose all of the limitations of claim 34, upon which claim 35 depends. Ramaswamy et al. further discloses:

the data structure generator removes segments from the data structure that do not meet a minimum frequency threshold (C.4.lines 29-31-it is well known that the relevancy of the segments is based in part on frequency), and dynamically re-segments the received corpus to improve predictive capability while reducing the size of the data structure (C.5.lines 1-3, C.5.lines 6-9-"to improve language model quality..." comprising evaluating perplexity change which is interpreted as the predictive performance).

### ***Conclusion***

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

- Wong (U.S. Patent No. 5,905,773) teaches application specific dynamic language modeling and reducing perplexity of a corpus.
- Ushioda (U.S. Patent No. 5,835,893 Nov. 10, 1998) teaches using clustering segments from a textual corpus based on frequencies and maximizing intra-segment similarity.
- Tillmann et al. (U.S. Patent 6,182,026 filed Jun. 26, 1998) teaches of dynamic language modeling and adjusting a lexicon to determine maximum approximation for segment alignment
- Strong (U.S. Patent No. 5,613,036 Mar. 18, 1997) teaches using a dynamic language modeling system

Art Unit: 2654

- Mahajan et al. (U.S. Patent No. 6,418,431 filed Mar. 30, 1998) teaches using a perplexity value to determine the relevancy of a language model to a segment of information.
- Gorin et al. (U.S. Patent No. 6,044,337 filed Oct. 29, 1997) teaches calculating a perplexity value and elimination of candidate segments that are cut off by a threshold.
- Kanevsky et al. (U.S. Patent No. 6,484,136 filed Oct. 21, 1999) teaches utilizing an updated language model to predict a probability of another corpus.
- Wyard et al. (U.S. Patent No. 6,167,398 filed May 13, 1998) teaches using language analysis methods (including n-grams) to determine similarity and dissimilarity between segments of information.
- Bahl et al. (U.S. Patent No. 5,195,167 filed Mar. 16, 1993) teaches ranking and grouping items based on similarity using statistics.

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Lamont M Spooner whose telephone number is 703/305-8661. The examiner can normally be reached on 8:00 AM - 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Talivaldis Smits can be reached on 703/306-3011. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
